

2020-2 期末试题解答

一、单项选择题

1. D 2. B 3. C 4. C 5. B 6. C

二、填空题

7. $\frac{\pi}{6}$. 8. 0. 9. $-\frac{1}{3}$. 10. $\cos x$.

三、基本计算题

11. 令 $u = \frac{y}{x}$, 则原方程化为 $\frac{du}{u(\ln u - 1)} = \frac{dx}{x}$,

两边积分得 $\ln u - 1 = Cx$.

所以原方程的通解为 $\ln \frac{y}{x} = Cx + 1$.

12. $z_x = y f'_1 + y g'(x) f'_2 = y[f'_1 + g'(x) f'_2]$

$z_{xy} = [f'_1 + g'(x) f'_2] + y[(x f''_{11} + g(x) f''_{12}) + g'(x)(x f''_{12} + g(x) f''_{22})]$.

$= f'_1 + g'(x) f'_2 + x y f''_{11} + [g(x) + x y g'(x)] f''_{12} + y g'(x) g(x) f''_{22}$.

13. 内层积分中的被积函数 $\sin y^2$ 的原函数不能由初等函数表示, 因此须交换积分次序. 依题意, 积分区域为

$$D = \{(x, y) | 1 \leq x \leq 3, x - 1 \leq y \leq 2\} \quad (\text{图中三角形区域}),$$

交换积分次序, 有

$$I = \int_0^2 dy \int_1^{1+y} \sin y^2 dx = \int_0^2 y \sin y^2 dy$$

$$= \frac{1}{2} \int_0^2 \sin y^2 d(y^2) = -\frac{1}{2} \cos y^2 \Big|_0^2 = \frac{1}{2} (1 - \cos 4).$$

14. 因区域 V 关于 3 个坐标面均对称且具有轮换性, 故

$$\iiint_V x^3 dv = \iiint_V y^3 dv = \iiint_V z^3 dv = 0; \quad \iiint_V x^2 dv = \iiint_V y^2 dv = \iiint_V z^2 dv,$$

于是

$$I = \iiint_V y^2 dv = \frac{1}{3} \iiint_V (x^2 + y^2 + z^2) dv = \frac{1}{3} \int_0^{2\pi} d\theta \int_0^\pi d\varphi \int_0^a \rho^4 \sin \varphi d\rho = \frac{4\pi}{15} a^5.$$

2020-2 (期末) -13 图

15. 解法 1 补面 $S_1: z = 2 (x^2 + y^2 \leq 4)$ 上侧, 则 $S + S_1$ 封闭, 且指向外侧.

$$\begin{aligned} I &= \oiint_{S+S_1} (z^2 + x) dy dz - z dx dy - \iint_{S_1} (z^2 + x) dy dz - z dx dy \\ &= \iiint_V 0 dv + \iint_S z dx dy = \iint_{x^2+y^2 \leq 4} 2 dx dy = 8\pi. \end{aligned}$$

解法 2 用统一投影法, 向 xy 平面投影, 得

$$\begin{aligned} I &= \iint_S [(z^2 + x)(-x) - z] dx dy \\ &= -\iint_D \left\{ -x \left[\frac{1}{2}(x^2 + y^2) \right]^2 - x^2 - \frac{1}{2}(x^2 + y^2) \right\} dx dy \quad (D: x^2 + y^2 \leq 4) \\ &= \iint_D \left[x^2 + \frac{1}{2}(x^2 + y^2) \right] dx dy = \iint_D \left[\frac{1}{2}(x^2 + y^2) + \frac{1}{2}(x^2 + y^2) \right] dx dy \\ &= \int_0^{2\pi} d\theta \int_0^2 r^3 dr = 8\pi. \end{aligned}$$

16. 因 $f'(x) = \frac{1}{1+x^2} = \sum_{n=0}^{\infty} (-1)^n x^{2n}, |x| < 1$, 所以

$$f(x) = \int_0^x \sum_{n=0}^{\infty} (-1)^n t^{2n} dt = \sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1} x^{2n+1}, |x| < 1.$$

当 $x = \pm 1$, 因 $\sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1}$ 及 $\sum_{n=0}^{\infty} \frac{(-1)^{n-1}}{2n+1}$ 均收敛, 由和函数的连续性, 得

$$f(x) = \sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1} x^{2n+1} \text{ 在 } x = \pm 1 \text{ 时也成立,}$$

$$\text{即 } \arctan x = \sum_{n=0}^{\infty} \frac{(-1)^n}{2n+1} x^{2n+1}, |x| \leq 1.$$

$$f^{(20)}(0) = 0, \text{ 由 } \frac{(-1)^n}{2n+1} = \frac{f^{(2n+1)}(0)}{(2n+1)!} \Rightarrow f^{(21)}(0) = 21! \cdot \frac{(-1)^{10}}{21} = 20!.$$

四、应用题

$$17. \text{ 令 } \begin{cases} f_x(x, y) = 4x^3 - 2x - 2y = 0 \\ f_y(x, y) = 4y^3 - 2x - 2y = 0 \end{cases}, \text{ 两式相减可得 } x = y, \text{ 带入方程 (1) 得: } x = 0$$

及 $x = \pm 1$, 所以 $f(x, y)$ 的驻点为 $(1, 1)$, $(-1, -1)$ 及 $(0, 0)$.

又 $f_{xx} = 12x^2 - 2$, $f_{xy} = -2$, $f_{yy} = 12y^2 - 2$, 所以

	A	B	C	$AC - B^2$	
(1,1)	10	-2	10	$96 > 0$	$f(1,1) = -2$ 为极小值
(-1,-1)	10	-2	10	$96 > 0$	$f(-1,-1) = -2$ 为极小值
(0,0)	-2	-2	-2	0	方法失效

由于 $f(0,0) = 0$, 取 $y = x$, 则 $f(x,y) = 2x^4 - 4x^2 = 2x^2(x^2 - 1) < 0$ (在 $(0,0)$ 附近);

取 $y = -x$, 则 $f(x,y) = 2x^4 > 0$ (在 $(0,0)$ 附近), 故 $(0,0)$ 不是极值点.

18. 由积分与路径无关, 得 $f'(x) - 2x = f(x)$, 即 $f'(x) - f(x) = 2x$.

$$\begin{aligned} f(x) &= e^{\int dx} (\int 2xe^{-\int dx} dx + C) = e^x (\int 2xe^{-x} dx + C) = e^x (-2e^{-x} - 2xe^{-x} + C) \\ &= Ce^x - 2x - 2. \end{aligned}$$

由 $f(0) = 1$, 得 $C = 3$, $f(x) = 3e^x - 2x - 2$.

选择积分路径为折线 L_1 : $y = 0$ (x 从 $0 \rightarrow 1$); L_2 : $x = 1$ (y 从 $0 \rightarrow 1$)

$$I = 0 + \int_0^1 [f(1) - 1] dy = f(1) - 1 = 3e - 5.$$

五、综合题

19. 利用极坐标

$$I = \iint_D \sin \sqrt{(x^2 + y^2)^3} dx dy = \int_0^{2\pi} d\theta \int_0^1 r \sin r^3 dr = 2\pi \int_0^1 r \sin r^3 dr.$$

因当 $t > 0$ 时, $\sin t < t$, 因此 $r \sin r^3 < r^4$. 又 $2\pi \int_0^1 r^4 dr = \frac{2}{5}\pi$,

故
$$\iint_D \sin \sqrt{(x^2 + y^2)^3} dx dy \leq \frac{2}{5}\pi.$$

20. 由泰勒公式 $f(x) = f(0) + f'(0)x + \frac{f''(\theta x)}{2}x^2$, $\theta \in (0,1)$ 及题设条件有

$$\left| f\left(\frac{1}{n^\alpha}\right) - 1 \right| = \frac{1}{2} \left| f''\left(\frac{\theta}{n^\alpha}\right) \right| \frac{1}{n^{2\alpha}} \leq \frac{M}{2} \frac{1}{n^{2\alpha}},$$

$\alpha > \frac{1}{2}$ 时, $\sum_{n=1}^{\infty} \frac{1}{n^{2\alpha}}$ 收敛, 故 $\sum_{n=1}^{\infty} \left(f\left(\frac{1}{n^\alpha}\right) - 1 \right)$ 绝对收敛.
